Back on track?

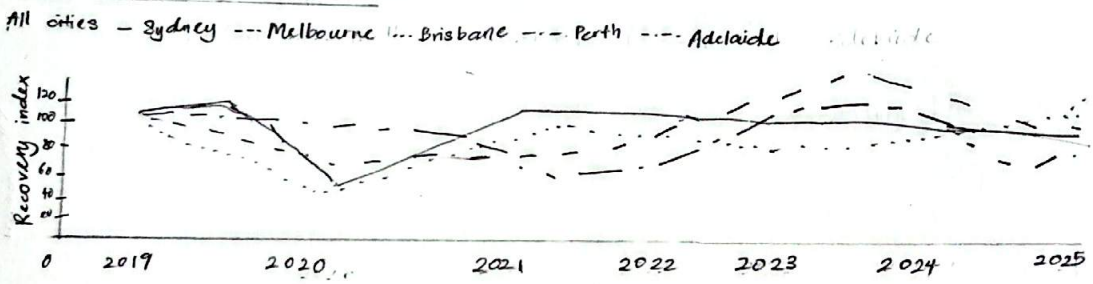

Australia's uneven rail recovery

Big cities, unfinished recovery

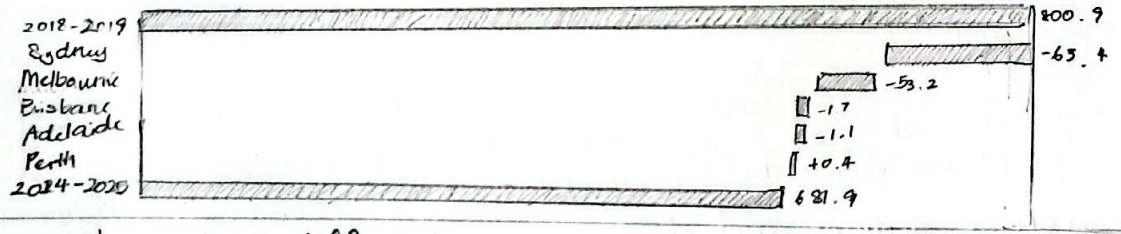

1. Two cities carry four in five journeys

2. Growth is not the same as recovery

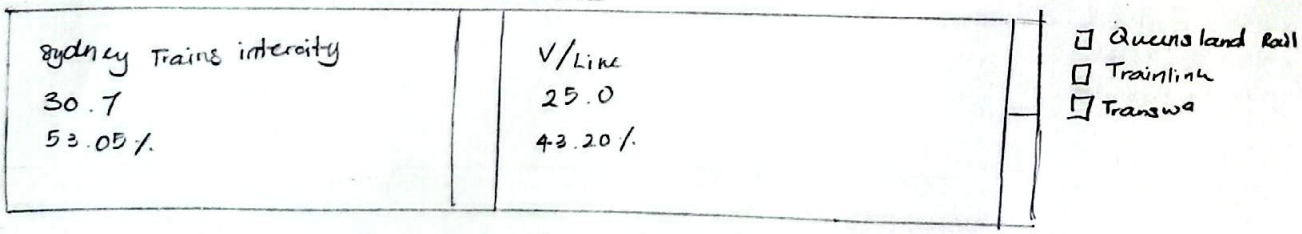

3. The biggest cities leave the biggest gap

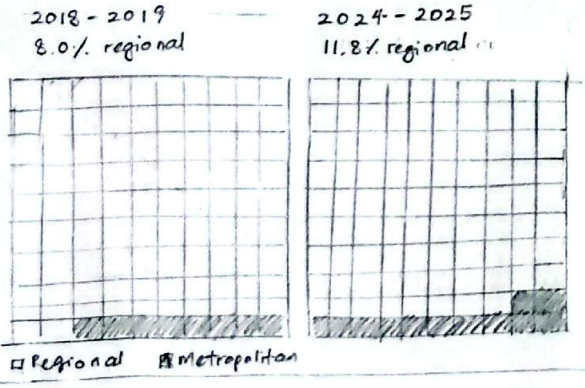

Different services, different recoveries

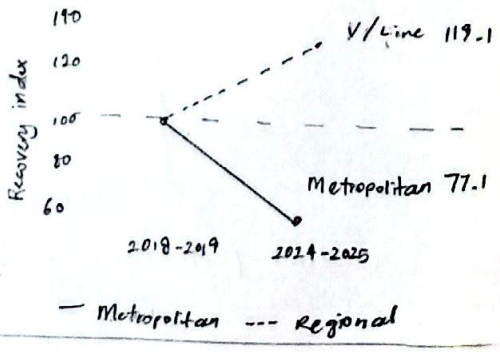

4. Two services dominate reported non-urban journeys

5. Regional rail takes a larger share

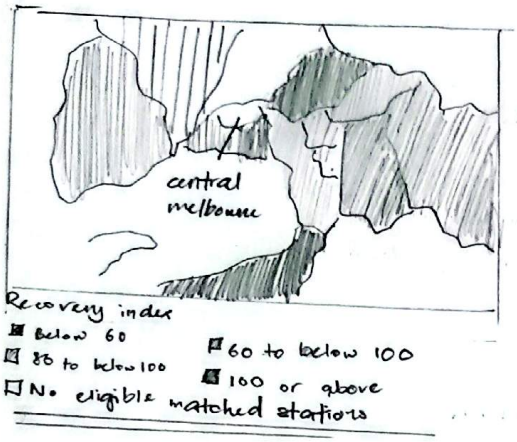

6. The two services move apart

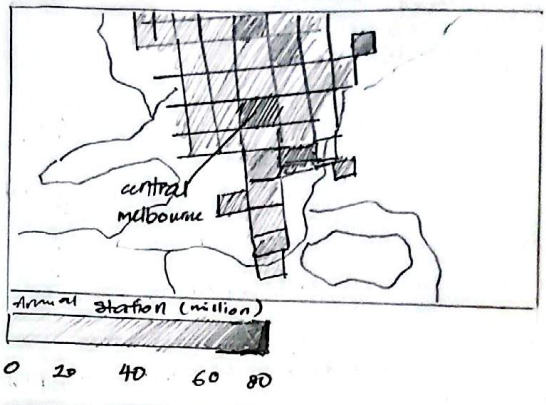

The recovery gap changes by place

7. Station - entry recovery varies across council areas

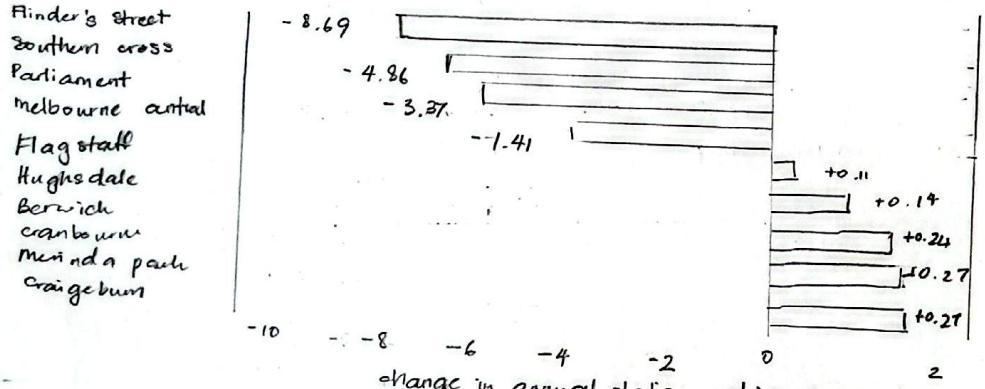

8. Entries still cluster in central Melbourne

Square width cell: 5 km

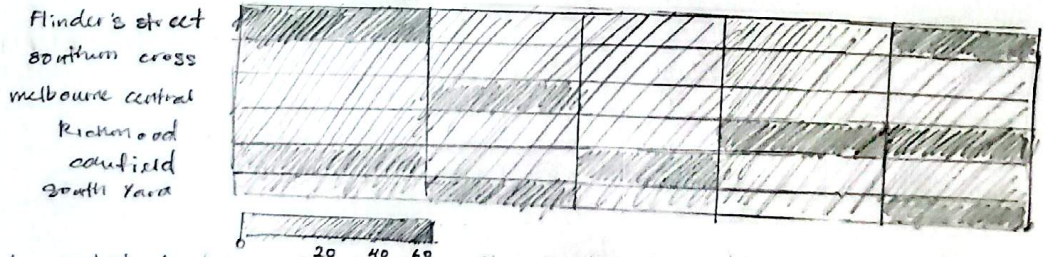

9. Large stations dominate absolute losses

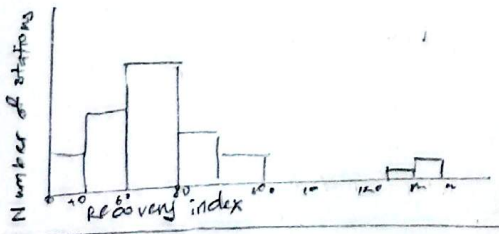

Rail use differs across stations and days

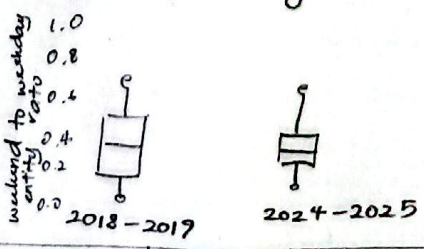

10. A city station's day differs from a suburban one

11. Most matched stations remain below baseline

12. Weekend use gains ground relative to weekdays

Back to track but not same patterns
